## In the Claims:

1-23. Cancelled.

24. (Currently Amended) A method of inducing organized, functional bone formation at a site of bone infirmity in a human, comprising the steps of:

- transforming a cultured mesenchymal stem cell with a (a) DNA encoding bone morphogenesis protein 2 (BMP-2);
- cultured mesenchymal stem cell (b) culturing the transformed in step (a), under conditions enabling expression of said DNA encoding bone morphogenesis protein 2; and
- implanting said cultured mesenchymal stem cell at a site (c) of bone infirmity

whereby autocrine and paracrine effects of expressed bone morphogenesis protein 2 at said site of bone infirmity result in organized, functional bone formation, thereby inducing organized, functional bone formation at a site of bone infirmity.

- 25. (Currently Amended) The method of claim 24[[3]], wherein said mesenchymal stem cell is a primary cell.
- 26. (Currently Amended) The method of claim 24[[3]], wherein said mesenchymal stem cell is a cultured cell line.
- 27. (Currently Amended) The method of claim 24[[3]], wherein said mesenchymal stem cell expresses an endogenous bone morphogenesis protein receptor.
- 28. (Previously Presented) The method of claim 24, wherein said mesenchymal stem
